# Handling Exceptions

# Objectives

After completing this lesson, you should be able to do the following:

- Define PL/SQL exceptions
- Recognize unhandled exceptions
- List and use different types of PL/SQL exception handlers
- Trap unanticipated errors
- Describe the effect of exception propagation in nested blocks
- Customize PL/SQL exception messages

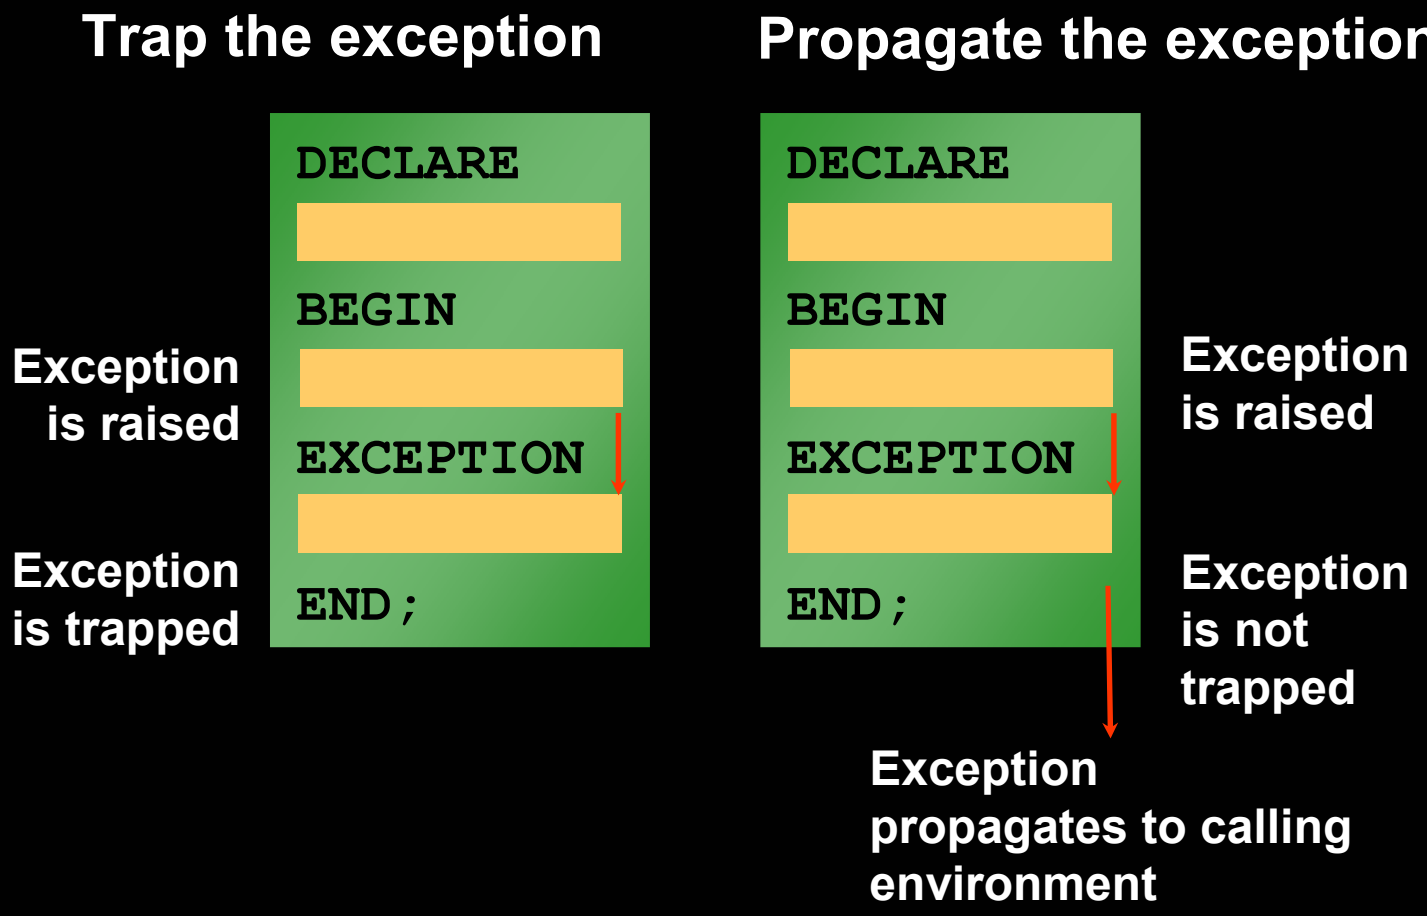
ORACLE

# Handling Exceptions with PL/SQL

- An exception is an identifier in PL/SQL that is raised during execution.
- How is it raised?
  - An Oracle error occurs.
  - You raise it explicitly.
- How do you handle it?
  - Trap it with a handler.
  - Propagate it to the calling environment.

ORACLE

# Handling Exceptions



# Exception Types

- Predefined Oracle Server
- Nonpredefined Oracle Server

} Implicitly raised

- User-defined — Explicitly raised

# Trapping Exceptions

## Syntax:

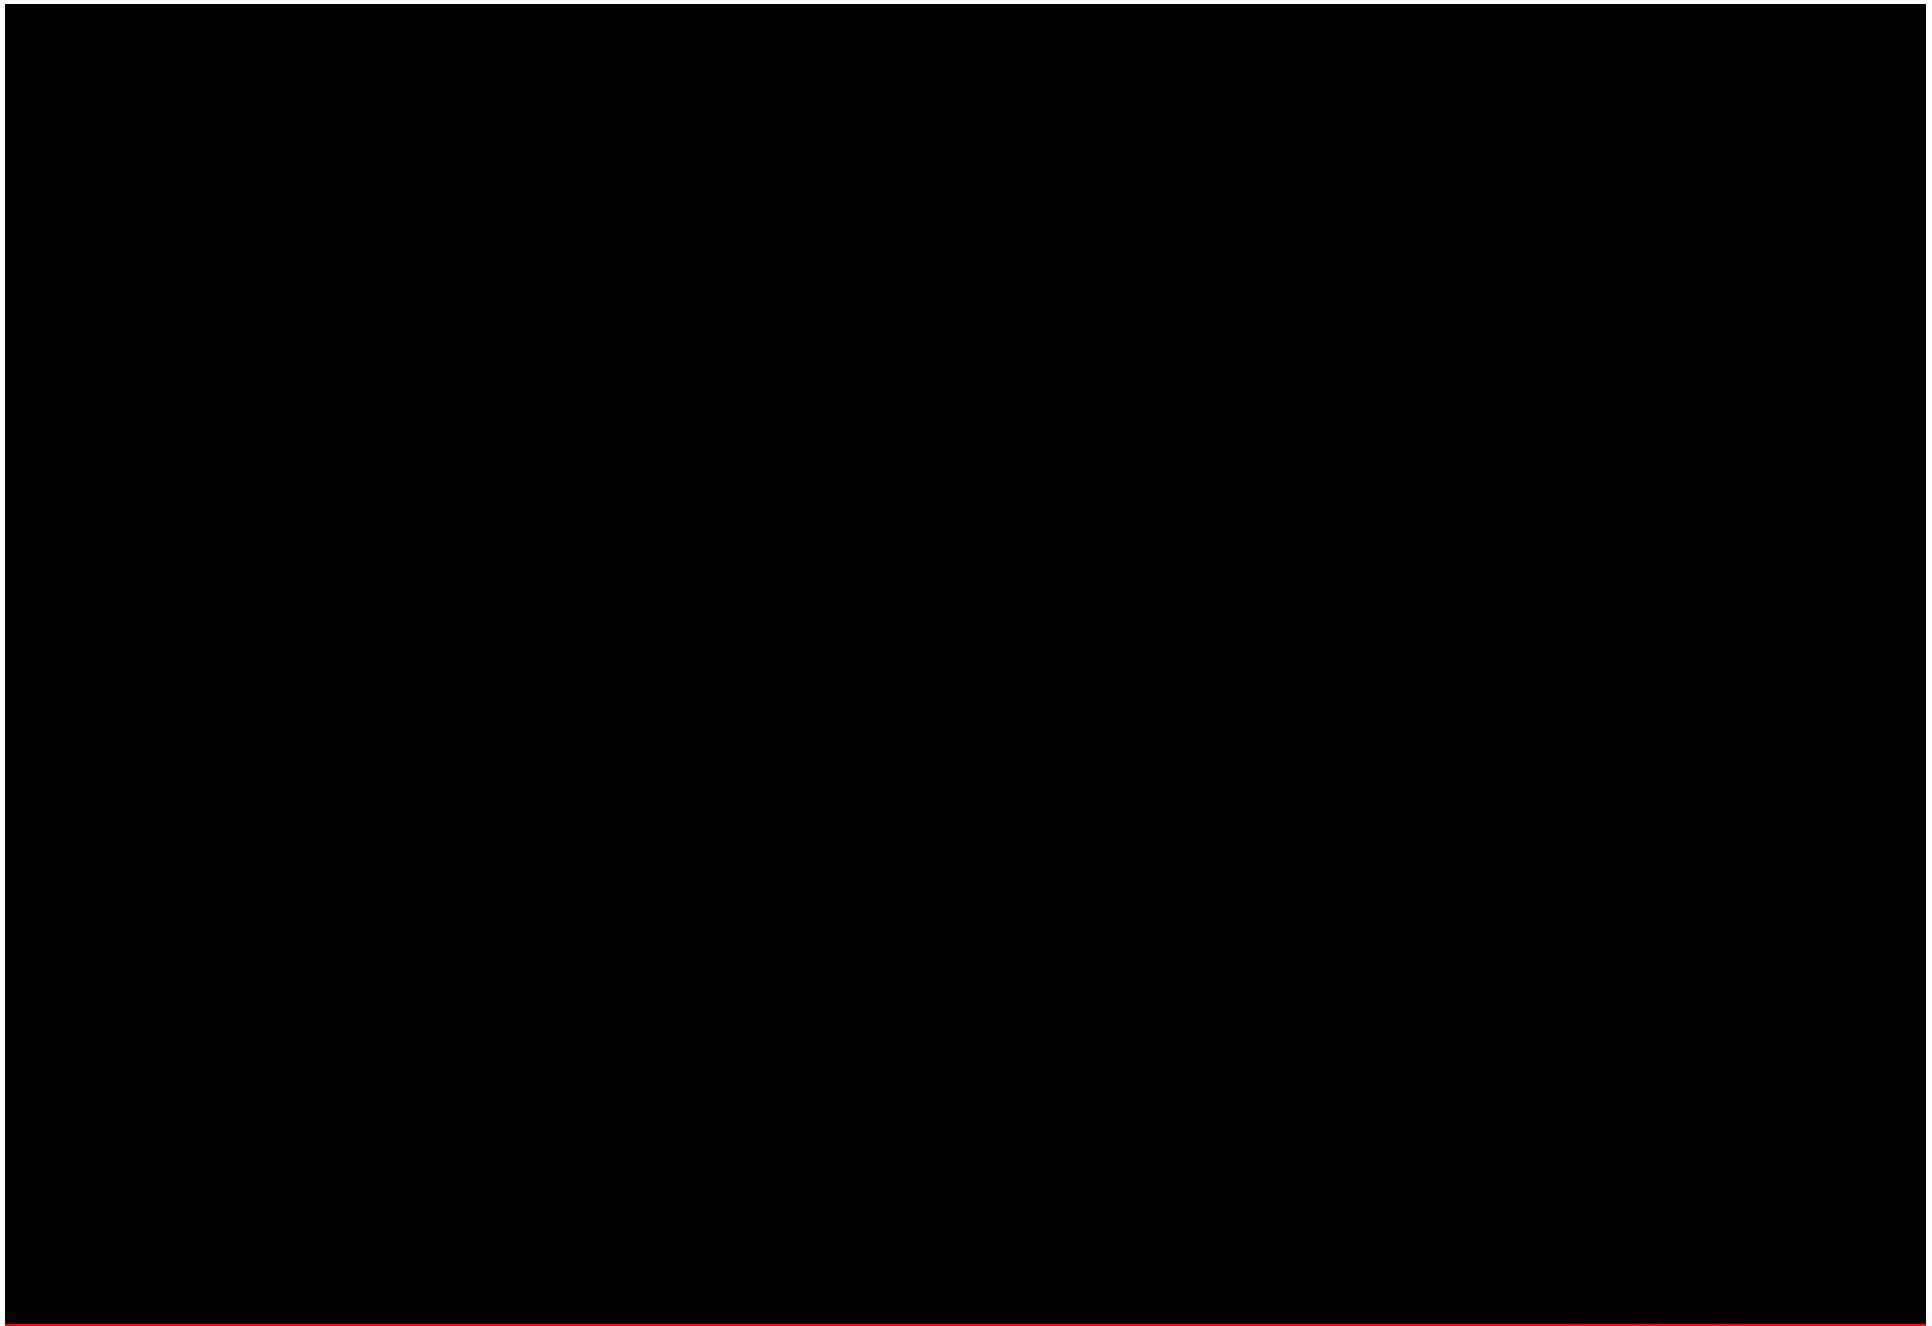
```
EXCEPTION
  WHEN exception1 [OR exception2 . . .] THEN
    statement1;
    statement2;
    . . .
  [WHEN exception3 [OR exception4 . . .] THEN
    statement1;
    statement2;
    . . .]
  [WHEN OTHERS THEN
    statement1;
    statement2;
    . . .]
```

# Trapping Exceptions Guidelines

- The `EXCEPTION` keyword starts exception-handling section.
- Several exception handlers are allowed.
- Only one handler is processed before leaving the block.
- `WHEN OTHERS` is the last clause.

# Trapping Predefined Oracle Server Errors

- Reference the standard name in the exception-handling routine.
- Sample predefined exceptions:
  - `NO_DATA_FOUND`
  - `TOO_MANY_ROWS`
  - `INVALID_CURSOR`
  - `ZERO_DIVIDE`
  - `DUP_VAL_ON_INDEX`



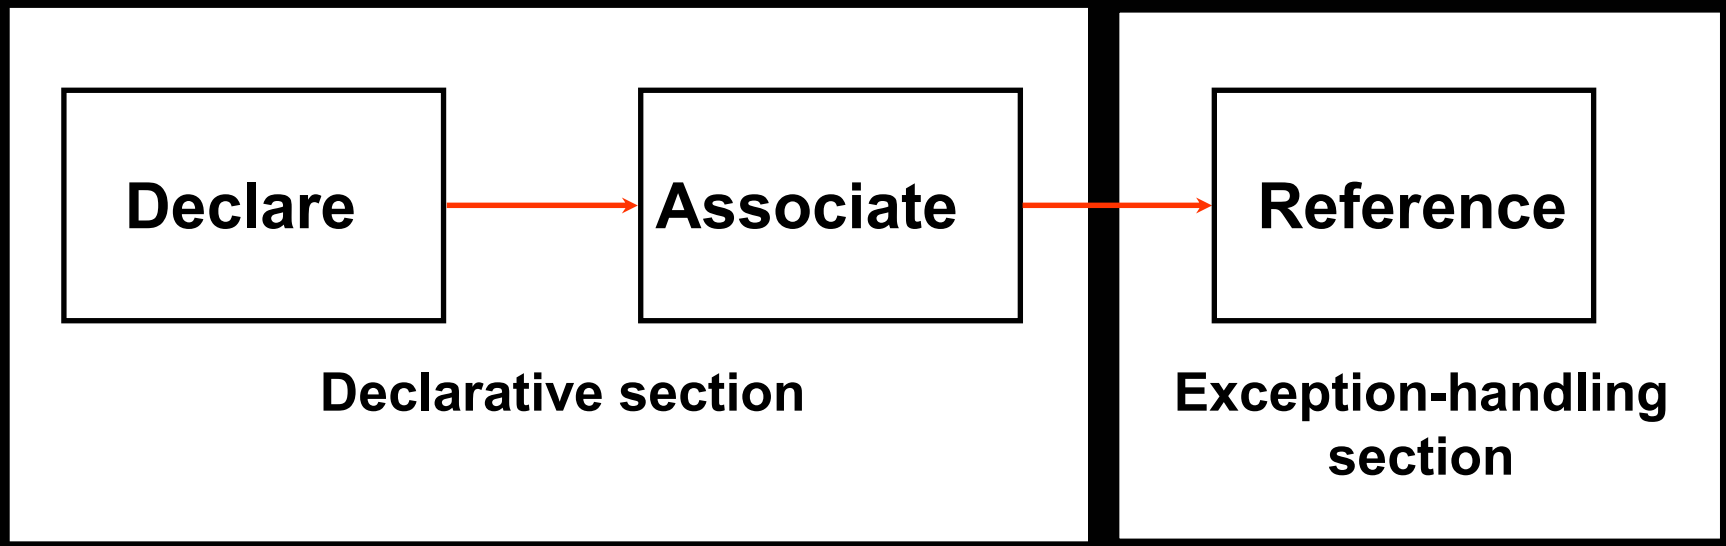
# Predefined Exceptions

**Syntax:**

```
BEGIN
. . .
EXCEPTION
  WHEN NO_DATA_FOUND THEN
    statement1;
    statement2;

  WHEN TOO_MANY_ROWS THEN
    statement1;
  WHEN OTHERS THEN
    statement1;
    statement2;
    statement3;
END;
```

# Trapping Nonpredefined Oracle Server Errors



Name the exception

Code the `PRAGMA EXCEPTION_INIT`

Handle the raised exception

# Nonpredefined Error

Trap for Oracle server error number –2292, an integrity constraint violation.

```
DEFINE p_deptno = 10
DECLARE
  e_emps_remaining EXCEPTION;
  PRAGMA EXCEPTION_INIT
    (e_emps_remaining, -2292);
BEGIN
  DELETE FROM departments
  WHERE  department_id = &p_deptno;
  COMMIT;
EXCEPTION
  WHEN e_emps_remaining  THEN
   DBMS_OUTPUT.PUT_LINE ('Cannot remove dept ' ||
   TO_CHAR(&p_deptno) || '.  Employees exist. ');
END;
```

2
3

# Functions for Trapping Exceptions

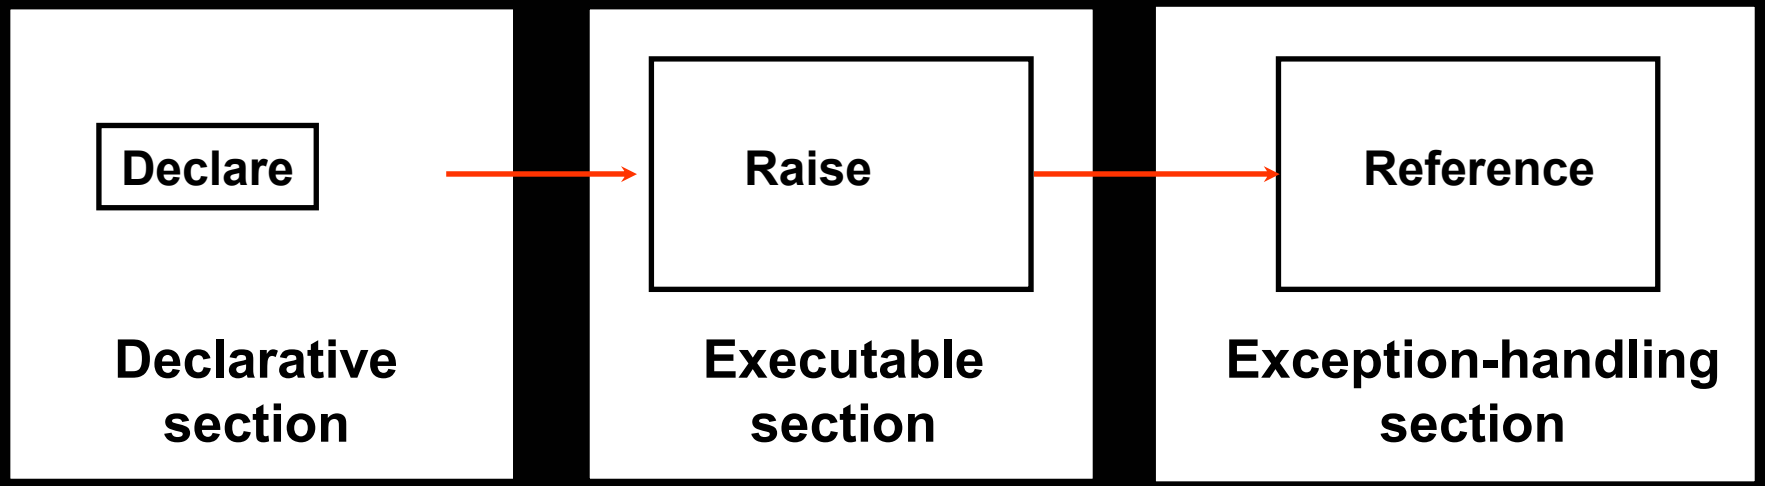
- `SQLCODE`: Returns the numeric value for the error code
- `SQLERRM`: Returns the message associated with the error number

# Functions for Trapping Exceptions

## Example:

```
DECLARE
  v_error_code      NUMBER;
  v_error_message   VARCHAR2(255);
BEGIN
...
EXCEPTION
...
  WHEN OTHERS THEN
    ROLLBACK;
    v_error_code := SQLCODE ;
    v_error_message := SQLERRM ;
    INSERT INTO errors
    VALUES(v_error_code, v_error_message);
END;
```

# Trapping User-Defined Exceptions



Name the exception.

Explicitly raise the exception by using the `RAISE` statement.

Handle the raised exception.

# User-Defined Exceptions

## Example:

```
DEFINE p_department_desc = 'Information Technology '
DEFINE P_department_number = 300
```

```
DECLARE
  e_invalid_department EXCEPTION;                          1
BEGIN
  UPDATE      departments
  SET         department_name = '&p_department_desc'
  WHERE       department_id = &p_department_number;
  IF SQL%NOTFOUND THEN
    RAISE e_invalid_department;                            2
  END IF;
  COMMIT;
EXCEPTION
  WHEN e_invalid_department THEN                           3
    DBMS_OUTPUT.PUT_LINE('No such department id.');
END;
```

# Calling Environments

| | |
|---|---|
| *i*SQL*Plus | Displays error number and message to screen |
| Procedure Builder | Displays error number and message to screen |
| Oracle Developer Forms | Accesses error number and message in a trigger by means of the `ERROR_CODE` and `ERROR_TEXT` packaged functions |
| Precompiler application | Accesses exception number through the `SQLCA` data structure |
| An enclosing PL/SQL block | Traps exception in exception-handling routine of enclosing block |

# Propagating Exceptions

Subblocks can handle an exception or pass the exception to the enclosing block.

```
DECLARE
  . . .
  e_no_rows       exception;
  e_integrity     exception;
  PRAGMA EXCEPTION_INIT (e_integrity, -2292);
BEGIN
  FOR c_record IN emp_cursor LOOP
    BEGIN
     SELECT ...
     UPDATE ...
     IF SQL%NOTFOUND THEN
       RAISE e_no_rows;
     END IF;
    END;
  END LOOP;
EXCEPTION
  WHEN e_integrity THEN ...
  WHEN e_no_rows THEN ...
END;
```

# The RAISE_APPLICATION_ERROR Procedure

**Syntax:**

```
raise_application_error (error_number,
                         message[, {TRUE | FALSE}]);
```

- You can use this procedure to issue user-defined error messages from stored subprograms.
- You can report errors to your application and avoid returning unhandled exceptions.

# The RAISE_APPLICATION_ERROR Procedure

- Used in two different places:
  - Executable section
  - Exception section
- Returns error conditions to the user in a manner consistent with other Oracle server errors

# RAISE_APPLICATION_ERROR

## Executable section:

```
BEGIN
...
  DELETE FROM employees
     WHERE  manager_id = v_mgr;
  IF SQL%NOTFOUND THEN
     RAISE_APPLICATION_ERROR(-20202,
       'This is not a valid manager');
  END IF;
   ...
```

## Exception section:

```
...
EXCEPTION
     WHEN NO_DATA_FOUND THEN
       RAISE_APPLICATION_ERROR (-20201,
         'Manager is not a valid employee.');
END;
```

ORACLE

# Summary

In this lesson, you should have learned that:

- Exception types:
  - Predefined Oracle server error
  - Nonpredefined Oracle server error
  - User-defined error
- Exception trapping
- Exception handling:
  - Trap the exception within the PL/SQL block.
  - Propagate the exception.

# Practice 8 Overview

This practice covers the following topics:

- Handling named exceptions
- Creating and invoking user-defined exceptions

```
SET SERVEROUTPUT ON
VARIABLE p_gaji
DECLARE
v_GAJI          EMP.SAL%TYPE:=&p_gaji;
tampung         EMP.ENAME%TYPE;
BEGIN
   SELECT ENAME INTO tampung FROM EMP WHERE SAL=V_GAJI;
   DBMS_OUTPUT.PUT_LINE('Gaji tersebut dimiliki oleh pegawai bernama ' ||
tampung);
EXCEPTION
   WHEN NO_DATA_FOUND THEN
      DBMS_OUTPUT.PUT_LINE('TIDAK ADA DATA');
  WHEN TOO_MANY_ROWS THEN
     DBMS_OUTPUT.PUT_LINE('Lebih dari satu pegawai punya gaji itu');
 WHEN OTHERS THEN
    DBMS_OUTPUT.PUT_LINE('TERJADI SUATU KESALAHAN');
END;
/
```

Pertanyaan :

- apa yang dikerjakan oleh program diatas ?
- kalau nilai variabel p_gaji diberi nilai 800, 1250, 999. hasilnya apa ?
